(*Note.*—In presenting the data for the stations, the order of the stations follows that of their geographical positions within the districts, and not the alphabetical order given above. A geographical list of the stations will be found on pp. 7 and 8.)

INTRODUCTION

The Weekly Weather Report was first issued in 1878 as an octavo weekly publication giving district values of rainfall and temperature. Figures for bright sunshine were added in 1880 and the format of the publication was changed to quarto in 1884. The volume for that year was entitled Volume I (New Series).

Since 1929 the publication has appeared as an annual volume containing statistics for weeks. Particulars of the changes then introduced and of the reasons for making them will be found in the Introduction to the volume, giving data for 1929, which was issued as Volume XLV (New Series). The present volume, which refers to the 58th year of publication, thus becomes Volume LII (New Series).

NOTES ON THE TABLES.

GENERAL. - The tables contain weekly, seasonal, and annual values of air temperature, rainfall and sunshine for the period of 52 weeks, extending from March 3rd. 1935 to February 29th 1936, that is from the beginning of Spring 1935 to the end of Winter 1935-36. The tables are of two kinds, showing values (a) for each of 12 districts into which the British Isles are divided, (b) for each of about 60 stations distributed over the British Isles at the rate of (normally) 5 stations per district.

NOTES ON THE TABLE OF DATA FOR DISTRICTS (Table 2).- The table of values for the weeks, seasons and the year for each of the twelve districts shown in the Frontispiece Map gives the following information:-

(a) Differences from the average of DAILY MEAN TEMPERATURE, ACCUMULATED TEMPERATURE AND DAYS OF PRECIPITATION. These differences are the arithmetical means of the corresponding differences from average for the (five) district-value stations in the several districts. The district-value stations are listed on pp. 7-8, and shown on the Frontispiece Map, and the difference for the stations are printed in Tables 3 to 59.

(b) TOTAL RAINFALL and DAILY MEAN SUNSHINE expressed as percentages of the corresponding averages. These are the arithmetical means of the corresponding percentages for the (five) district-value stations in the several districts, as printed in Tables 3 to 59.

The considerations which led to the selection of these methods of computation are set out on p.5 of Vol. XLV. For the present volume new averages of temperature and sunshine have been brought into use. These have been derived by graphical interpolation from monthly averages for the years available during the period 1901 to 1930. The actual years used are given in the table on pages 7 and 8.

NOTES ON THE TABLES OF DATA FOR STATIONS (Tables 3 to 59). - The following remarks apply to the tables of data for stations:-

The HEIGHT OF THE STATION is the height above mean sea level, expressed in feet, of the ground upon which the rain-gauge stands.

The TEMPERATURE OF THE AIR is measured by thermometers exposed in a Stevenson Screen, on a four-legged stand, about 4 ft. above the ground, except at Kew Observatory and Valentia Observatory, where north wall screens are in use, and Eskdalemuir Observatory where a large louvred screen is employed.

The mean daily maximum and minimum temperatures are extremes for 24 hours ending 9h. in the case of the following stations:- Kirkwall, Fort Augustus, Inverness, Nairn, Marchmont, Dundee, Scarborough, Clacton, Rothamsted, Harrogate(from 1st July) Nottingham, Oxford, Margate, Marlborough, Oban, Stonyhurst, Southport, Rhayader, Bath, Cullompton, Falmouth, Waterford, Jersey. The mean daily maximum and minimum temperatures are extremes for 24 hours ending 21h. in the case of the following stations:-Edinburgh, Cockle Park, Durham, York, Cambridge, Tottenham, Hastings, Southampton, Dumfries, Rothesay, Newton Rigg, Markree Castle, Armagh, Dublin. Mean daily maximum temperatures are the means of the highest temperatures in daily periods 7h. to 18h., and mean daily minimum temperatures are the means of the lowest temperatures in daily periods 18h. to 7h. in the case of the following stations:- Renfrew (Abbotsinch), Lerwick, Stornoway, Aberdeen, Cranwell, Yarmouth, Harrogate (until 30th June) Birmingham, Ross-on-Wye, Kew Observatory, Eskdalemuir, Sealand, Holyhead, St. Ann's Head (Pembroke), Malin Head, Birr Castle, Blacksod Point, Valentia Observatory, Roche's Point, Scilly, Guernsey. The extreme maximum and minimum temperatures for the week, season, or year at these last stations are, however, the absolute highest and lowest values recorded throughout the whole period. Occasionally the highest temperature is recorded during the night and the lowest during the day.

The mean daily temperature is defined as the mean of the corresponding mean daily maximum and minimum temperatures.

The ACCUMULATED TEMPERATURE above 42°F. is measured by the product of the excess of air temperature above the fixed base-value of 42°F., and the time during which the excess persists. Similarly the accumulated temperature below 42°F. is the product of the defect of air temperature from 42°F. and the time during which the defect persists. Accumulated temperature is expressed in "day-degrees" -a day- degree signifying 1°F. of excess or defect of temperature above or below 42°F., continued for 24 hours, or any other number of degrees continued for an inversely proportional number of hours.

Values of accumulated temperature are intended to afford to persons engaged in agriculture better means of estimating the manner in which vegetation is affected by temperature, than that afforded by the more usual methods of treating the readings of the thermometer. The base temperature of 42°F. (nearly 6°C.) has been considered by continental writers to be the critical value, the temperature above which is mainly effectual in starting and maintaining the growth, and in completing the ripening, of agricultural crops in a European climate.

To compute the accumulated temperature accurately it would be necessary to integrate the excess or defect of temperature above or below the critical limit by utilising instantaneous values throughout the period. In practice we are content to make an approximation. The rules which have been used in this volume for the computation of accumulated temperature are set out and discussed on pp. 7, 8 of Vol. XLV.

RAINFALL.- The daily measurements of rainfall refer to periods of 24 hours beginning at the hour of morning observation, i.e., the measurement made in the morning is entered to the preceding day. The gauges are of 8-in. or 5-in. diameter and the rims are at a height of one foot above ground.

The number of days with precipitation, in the case of stations where rainfall is measured in inches, is the number of days to which a measurement of ·01 in. or more is credited. In the case of stations where the measurement is made in millimetres, it is the number of days to which a measurement of 0·2 mm. or more is credited. The averages of rainfall and raindays are the actual or estimated averages for the period of 35 years, 1881-1915.

SUNSHINE.- The records are obtained from Campbell-Stokes recorders, of which a description is given in the Meteorological Observer's Handbook. The records consist of blue cards upon which the duration of sunshine is recorded as a charred

trace produced by the motion of the sun's image thrown on the card by a 4-in. spherical lens. The trace during intermittent sunshine is extended by charring of the card beyond the true limits at which the sun emerges and is obscured, and an allowance, resting on long practice, is made for this extension. The allowance is less than that which would reduce the record of intermittent burns of short duration in very bright sunshine sufficiently to give the actual time during which the sun was unobscured. The values are, therefore, on the average, slightly in excess of the actual duration of sunshine of intensity sufficient to scorch the card.

The possible duration of sunshine with which the recorded duration is also compared is the length of the day, beginning and ending when the centre of the sun would be visible in the horizontal plane through the station, if it were not for obstruction by hills, etc. Allowance is made for the refraction of light. It should be noted, however, that in the most favourable circumstances, the Campbell-Stokes instrument does not record sunshine when the sun is less than about 3° above the horizon so that 100 per-cent. of possible duration never occurs.

TEMPERATURE ON THE GRASS.- The "grass minimum" temperature is obtained from a minimum thermometer of which the stem is protected by an outer glass tube. The thermometer is placed so that it is just level with the top of short grass, i.e. about 2 inches above the ground. The grass minimum thermometer does not record the temperature of the air at its own level, but rather its own temperature, i.e. that of a bulb filled with spirit, losing heat by radiation in all directions, and receiving heat by radiation from the clouds, from the atmosphere itself, from the ground and surrounding objects, and by contact with the air. Although the thermometer gives neither the temperature of the air nor of the grass-blades, its readings give a much better idea of the degree of cold to which the upper surfaces of low-lying vegetation are exposed than do those of the minimum thermometer in the screen. A night is reckoned as a NIGHT OF GROUND FROST if the minimum temperature indicated by the grass-minimum thermometer is 30·4° F. or below.

EARTH TEMPERATURE.- The temperature of the ground at depths of 1 foot and 4 feet is obtained by means of " earth thermometers. " The bulb of an earth thermometer is embedded in a non-conducting material (usually paraffin wax) contained in a glass tube about 1 inch in diameter. The whole is suspended at the requisite depth in an iron tube sunk vertically in the ground. The internal diameter of the iron tube is only slightly greater than the external diameter of the earth-thermometer. The iron tube is closed at the bottom and covered at the top by a metal lid which prevents the entrance of water into the tube. For the readings, which are usually made at 9h.G.M.T., the thermometer is pulled up from the tube. Separate iron tubes are used for the thermometers at the two depths.

DISTRICTS, DISTRICT VALUE STATIONS AND YEARS USED FOR COMPUTATION OF AVERAGES.

(Note - For all stations the averages of rainfall and number of raindays are actual or adjusted averages for the period 1881-1915; the averages of accumulated temperature are actual or adjusted averages for the period 1907-1926.

The positions of the stations and the boundaries are shown in the Frontispiece Map. A list of the districts and stations is appended:-

District	Stations	Years used for averages of		
		Temperature	Earth Temperature	Sunshine

CHANGES IN DISTRICT VALUE STATIONS DURING THE PERIOD MARCH 3rd, 1935 - FEBRUARY 29th, 1936.

No change has occurred in the selection of stations used for the computation of values for districts, but the following notes on the stations are recorded, since they affect the data published in this volume.

District 0. - STORNOWAY. The percentages of and differences from averages in the case of rainfall continue to refer to Matheson Road.
FORT AUGUSTUS. Averages of sunshine are not available owing to a defective recorder having been used in past years.

District 1. - MARCHMONT. During the currency of Summer Time (April 14th. - October 5th, 1935) observations at Marchmont were taken at 8h. G.M.T. instead of 9h. G.M.T.

District 6. - OBAN. Averages of rainfall and temperature for the new site are not available.

District 2. - SCARBOROUGH. The earth thermometer is at a depth of 3ft.

District 4. - HARROGATE. As from July 1st. the observations were taken at 9h only instead of at 7h. and 18h.The averages of temperature were adjusted accordingly

District 5. - HASTINGS. A change of site was made on August 1st.from Gensing Gardens, St.Leonards to White Rock, Hastings.The averages are not affected by this change.
- MARLBOROUGH. During the currency of Summer Time (April 14th. to October 5th, 1935) observations were taken at 8h. G.M.T. instead of 9h. G.M.T.

District 7. - SOUTHPORT. Sunshine is recorded at Hesketh Park, other readings at Bedford Road Park.

District 8. - In the absence of averages of accumulated temperature for Rhayader (see Vol. XLV, p.9) the District differences of accumulated temperature are the means of corresponding differences for four stations instead of five.
RHAYADER. From June to December inclusive observations were unreliable and were omitted, district values being computed from four stations instead of five.

District 9. - BLACKSOD POINT. A reliable average of temperature is not available. The sunshine recorder is at Mallaranny(Lat. 53° 55'N.,Long. 9° 47'W.)18 miles to the South East of Blacksod Point.

District 10.- DUBLIN (City). The sunshine recorder is in Phoenix Park, Dublin (Lat. 53° 22'N.,Long. 6° 21'W.)
ROCHE'S POINT. -The sunshine recorder is at Ballinacurra (Lat.51° 52'N., Long. 8° 10'W.) 8 miles NNE. of Roche's Point.

WEEKLY DISTRICT NORMALS.

Normals of mean temperature, number of rain-days, rainfall and daily duration of sunshine for each of the twelve districts of the British Isles, and for each of the 52 weeks of the year, derived from observations for the 35 years 1881-1915,are printed in Table I. These are the district "Normals" which were used in the preparation of the volume of the Weekly Weather Report for 1927-8 and earlier volumes, with the exception that the values of mean temperature now printed are the arithmetic means of mean maximum and minimum temperatures and not "Strachey" means (see Vol. XLV, p.8).The values of mean temperature for districts now given are therefore prepared on the same basis as the values of mean temperature for stations which appear in this volume. The differences between the normals now published and the "Strachey" normals used in earlier volumes of the Weekly Weather Report are greatest in June, for which month the values now published exceed the "Strachey" means by about half-a-degree Fahrenheit. The differences vanish altogether in the months of February and November, while in December and January the values given here are 0·1° or 0·2°F. less than the "Strachey" means.

Weekly normal values of mean temperature, rainfall and sunshine, for districts, for the same period of 35 years, were also published in 1920 in Section II of The Book of Normals. Since the date of that publication some minor changes have, however, been made in some of the values owing to changes which have occurred in the list of district-value stations. As explained in Vol. XLV, p.5, the district-normals were computed to represent the means of the corresponding station-normals, so that any change in the list of district-value stations was liable to affect the district normals.

Table I also contains normals for the four seasons of the year and for the whole year, for each of the districts. The seasonal normals differ slightly from those published in Section II of The Book of Normals for the additional reason that the seasons used here are certain definite combinations of weeks, as indicated in the table, whereas in The Book of Normals the seasons are defined as four periods,each of three calendar months.

I.—NORMAL VALUES OF MEAN TEMPERATURE, NUMBER OF RAIN-DAYS, RAINFALL, and DAILY DURATION OF SUNSHINE for each week of the year in the twelve districts of the British Isles, for the period of **35 years, 1881–1915.**
